# What's New in Interact Version 7

Now includes all Modules!

The most significant update to Interact in a decade! Interact Version 7 now includes all available modules at one low price. Interact Version 7 is being released in parallel with the new PA2 PowerStations. The Interact Version 7 development package includes all available Interact modules at no extra cost and the PA2 PowerStations come pre-enabled to support all runtime modules. PA and prior generation PowerStations will need to be upgraded to Interact Version 7 in order to support this functionality.

Improved graphics and user experience.

Version 7 menus, dialogs and packaging have all been updated to resemble our InteractX and Interact Xpress product. The crisper more modern look and feel brings the Interact product in line with our corporate standard branding and presents the user with an updated look and feel that makes the Version 7 release immediately identifiable.

The new DVD case packaging also significantly reduces our impact on the environment by reducing our packaging material by more than 47%.

Updated FlashBack utilities now install with development.

Interact Version 7 includes FlashBack utilities for every Interact Platform that we've offered in the last decade! Including the following:

> PS Series PowerStations.
> PA/PA2/P13 Series PowerStations.
> PA200 – No display PowerStations.
> HPC Series PowerStations configured for Interact.

And best of all, the utilities are now automatically installed on your development system when you install Interact – so there is no searching for the correct Flashback – just install Interact development and go!

Improved Cable Dictionary.

Our cable distionary has been updated with improved and complete cable schematics. Always one of our most popular resources, the cable dictionary is even better in Version 7.

Driver Updates.

CMOT v7.00 – Updated to provide improved compatibility with 6000 series language controllers and drives, specifically the Zeta 61XX.
