InteractX Administrative Privileges

InteractX is an environment used to create GUI interfaces for use on a PC, InteractX uses drivers for communicating using various industrial protocols to external devices. InteractX specifically allows programmer to use VBA and data management tools to create powerful, factory date information and actionable insights for the operator.

These powerful tools require **administrative privileges** on the PC using InteractX. Failure to provide administrivia privileges to users operating this software will severely limit its capabilities. Part of this limitation is native to the design of Microsoft which requires any software that modifies the Windows Registry to have administrative permissions.

In cases where restricted access is mandated, we recommend that the IT professionals in charge of security contact our applications team. There may be some actions that can be taken to allow using InteractX whilst also limiting their access. Unfortunately, due to the inherent complexities of some IT security restrictions and additional overriding setting of systems, the only way to guarantee the expected function of InteractX is to run it on a system with full administrative privileges. It is the responsibility of the IT professionals to determine what is appropriate for their system and the best actions to provide the appropriate permissions.
